### **ABSTRACT**

Gangrene is always considered untreatable and can only be stopped by amputation. Often the surgery fails to remove all the infection and more of the limb has to be cut off. This is a report about stopping gangrene with a non-invasive treatment taking only a few minutes and not using any drugs.

### **KEYWORDS**

Gangrene; Infection; Surgery

### **WHAT HAPPENED?**

Elmer was leading soldiers in the jungle of Peru when a landmine exploded injuring his legs. By the time he got to hospital, gangrene had set in. He was eight years in hospital suffering repeated amputations. The doctors were unable to stop the infection, so they removed his legs bit by bit until there was nothing left to remove. That was when the CellSonic doctor, Dr Dario Rodriguez [dariore@gmail.com](mailto:dariore@gmail.com), heard about the plight and was invited to treat the officer. He applied one treatment as shown in the photograph. All the infection was stopped [1,2].

At last Elmer could return home. The video of the presentation at the military heroes' association shows Elmer now fit and well in a wheelchair. In a touching scene, he receives a kiss from his wife. CellSonic saved his life.

### **THE CURE**

The prime force for killing infection is pressure. CellSonic emits very intense pressure pulses (VIPP) four times a second that kill viruses, bacteria and parasites. It is not necessary to know what the germs are or exactly where they are. Treat all the area and beyond to catch everything. More oxygen is sent in the blood to the site. Vascularisation is increased. Nitric oxide is increased. Stem cells of the right type in the right quantity are sent to exactly the right location under instructions from the immune system alerted by the CellSonic VIPP. New

skin is grown embedded with nerves [3]. Nerves that served the severed limbs are re-programmed to stop phantom pain. All this happens within the CellSonic treatment. No drugs are used and there are no side effects (Figure 1 - Figure 4).
